

## ABSTRACT OF THE DISCLOSURE

The invention of serially, pin-numbering, or coding of bullets, bullet casings, and other projectiles on their bodies, with information such as the name of ammo maker; country of origin; type of gun; and abbreviation of the Government Agency, whose responsibility would be to register firearms, issue licenses, and maintain a database track records of firearms and ammunition sold by the ammo shops in the country, is a new art in the use of firearms and ammunition and management to trace firearms crime offenders. The invention makes ammunition the prime tracing point for any firearms crime related offence, rather than guns which have been the traditional core tracing point for firearms crime investigations. Since the bullet does the killing or wounding when a firearm is fired at someone, by introducing my invention, it would become easier, quicker, and accurate to trace and arrest actual firearms crime offenders, by the records of ammunition used in the committing of crimes; with ammo owners as prime suspect to provide clues leading to crime offenders. This mechanism saves much time, reduces efforts, materials, funds, and threats of crimes on the people. The idea of the return of empty bullet casings with firearms use incident reports by firearms carriers to the Agency, and the introduction of "Firearms Use Oversight Responsibility" and "Firearms Use Oversight Tax" are new in the management of firearms and ammunition use.
